Current research directions

Scientific applications, methods in development and study design.

1. Scientific applications

Multi-host disease, marine ecosystems, spatial processes and cultural evolution.

2. Methods in development

Parameter inference and calibration, structural evaluation, rank selection and replicated studies.

3. Surveillance and intervention studies

Vaccination strategies, scenario campaigns and surveillance design. Compare model results under stated assumptions.

Observations and study results inform revisions to models and study designs. This agenda includes operational work, methods under development and planned applications.
