pp-eigentest: fit, check, select

Sequential fitted-model rank selection; private pre-release work.

1. Fit the observed entries

Incomplete matrix and explicit mask
Fit and refit the selected latent-variable model.

↓

2. Check predictive reliability

Held-out predictive scores, coverage and convergence
Record capacity, calibration and stopping diagnostics.

↓

3. Select with fitted-model spectra

Posterior-predictive spectral comparisons
Return a rank decision together with its diagnostics.

NumPy is the reference path. Earlier consensus methods are supplementary analyses. Mask-aware fitting alone does not identify the missingness mechanism.
