Simulation, inference and decisions

Public tools connect to working research software for inference.

Model specification

op_system
Fields, equations and reactions
Operators and observables

→

Numerical execution

op_engine
PDE / nonlocal / reactions
Deterministic and stochastic

Campaign orchestration

FlepiMoP2
Scenario campaigns
Replaceable providers

Design and evaluation

trade-study
Replicated comparisons
Pareto analysis / preferences

op_infer: inference and calibration

Bayesian parameter fitting, simulation-based calibration and study-design checks. Private, pre-alpha and unreleased.

The four public tools above support specification, simulation, campaigns and evaluation. op_infer builds on established fitting libraries and these public tools.

The cores can also run independently of the campaign framework. Application-specific scientific validation remains necessary across operational and research uses.
