Generalize, harden, operationalize

A research agenda with observations and decisions in the same loop.

1. Generalize the scientific systems

Multi-host disease, marine ecosystems, spatial processes and cultural evolution.

↓

2. Harden inference and evaluation

Missing-data models, predictive diagnostics, rank selection, replicated studies and declared calibration criteria.

↓

3. Operationalize decisions

Vaccination strategy, scenario campaigns and surveillance design, with reproducible evidence for each application.

Observations, diagnostics and policy feedback motivate new model and study choices. This agenda includes operational, active-research and planned work; it is not a deployment map.
